

# Transcranial Magnetic Stimulation Assisted Drug Development

Validation and implementation in early  
phase development of novel drugs targeting  
cortical excitability

Prof.dr.ir. M.J.A.M. van Putten  
Neurophysiologist, Medisch Spectrum Twent

C.M.K.E. de Cuba, MD  
Experienced Clinical Scientist, Centre for Human Drug Research

TADD-talk TechMed Event 6-Nov-2024

CHDR  
Centre for Human Drug Research

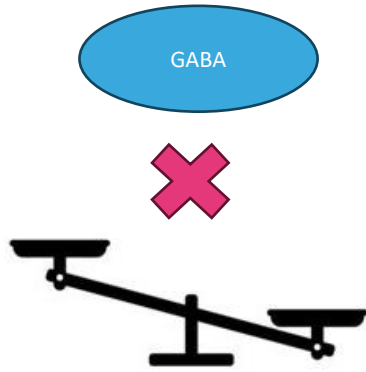

# Transcranial Magnetic Stimulation (TMS)

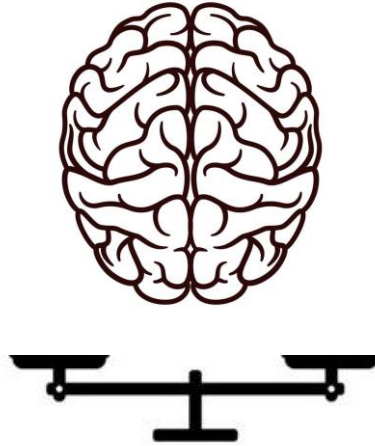

Barker AT et al. *The Lancet*. 1985; de Goede AA et al. *Clin Neurophysiol*. 2016

Inhibition

Sodium channel blocker/ GABA agonist  
SV<sub>2</sub>A ligand  
Benzodiazepines (GABA<sub>A</sub>R agonist)  
Neurosteroid (GABA<sub>A</sub>R agonist)

Excitation

S-Ketamine (NMDAR antagonist)  
Novel AMPAR agonist  
Immunomodulator (glutamate inhibitor)

# TMS biomarkers for excitation/inhibition

> Single-pulse TMS-EMG

> Paired-pulse TMS-EMG

## MEP amplitude effects

## LICI 100 ms

# Conclusions & Future perspectives

- › TMS adds value in early phase drug development!
  - › Effects align with known mechanisms of action
  - › Distinguish between novel and benchmark drugs
  - › Dose-proportional effects → dose selection
  
- › What's next? Keep on building!
  - › More benchmark drugs
  - › More selective drugs
  - › Correlation TMS and other excitation/inhibition biomarkers
  - › Healthy volunteers → Patients → Personalized medicine

Thank you for  
your attention!
